

Q. 1 — Explain Workflow orchestration

Question

Explain the concept in plain language. Include:

- **its main purpose;**
- **where it fits in the lesson workflow;**
- **one mistake a new learner should avoid.**

A workflow orchestration is the process that says which task has to be executed, when they have to do it and in which order.

A workflow orchestration doesn't go to show errors in the pipeline, it is just going to show the errors referring to the runs.

Q. 2 — Connect Workflow orchestration and Apache Airflow

Question

- **Explain the role of each concept.**
- **State how they are related.**
- **Identify one reason they should not be treated as interchangeable.**

Workflow orchestration is the process of running jobs in a specific moment and order. And Apache Airflow is the tool that creates and controls the workflows (scheduling, monitoring, executing them).

They are not interchangeable because the workflows are a part inside of the Apache Airflow work.

Q. 5 — MCQ: Purpose of Workflow orchestration

Which statement best matches the lesson?

- A. In plain words: Orchestration decides what should run, when it should run, and what is allowed to run next. Without orchestration, a team might start scripts manually or use separate tools.
- B. It guarantees that every data pipeline finishes without failures.
- C. It removes the need for validation and documentation.
- D. It replaces every storage, processing, and orchestration tool.

Q. 6 — MCQ: Applying Apache Airflow

What should the learner do before accepting a result involving Apache Airflow?

- A. Assume the first successful run is correct.
- B. Verify the output against the requirement and retain evidence.
- C. Remove all checks to reduce the amount of work.
- D. Add unrelated tools before understanding the concept.

Q. 11 — MCQ: Purpose of Scheduler

Which statement best matches the lesson?

A. The scheduler decides when DAG runs should be created and which task instances are ready to run. If the webserver is running but the scheduler is not, the UI may open but scheduled

B. It guarantees that every data pipeline finishes without failures.

C. It removes the need for validation and documentation.

D. It replaces every storage, processing, and orchestration tool.

Q. 12 — MCQ: Applying Webserver and Airflow UI

What should the learner do before accepting a result involving Webserver and Airflow UI?

A. Assume the first successful run is correct.

B. Verify the output against the requirement and retain evidence.

C. Remove all checks to reduce the amount of work.

D. Add unrelated tools before understanding the concept.

Q. 17 — MCQ: Purpose of Executor

Which statement best matches the lesson?

A. The executor controls how tasks are launched. For beginners, remember the responsibility rather than memorising every executor type: The scheduler decides what is ready.

B. It guarantees that every data pipeline finishes without failures.

C. It removes the need for validation and documentation.

D. It replaces every storage, processing, and orchestration tool.

Q. 18 — MCQ: Applying DAG

What should the learner do before accepting a result involving DAG?

A. Assume the first successful run is correct.

B. Verify the output against the requirement and retain evidence.

C. Remove all checks to reduce the amount of work.

D. Add unrelated tools before understanding the concept.

Q. 23 — MCQ: Purpose of Operator

Which statement best matches the lesson?

A. An operator is a template used to create a task. Core distinction: Operator = task template.

B. It guarantees that every data pipeline finishes without failures.

C. It removes the need for validation and documentation.

D. It replaces every storage, processing, and orchestration tool.

Q. 24 — MCQ: Applying DAG file structure

What should the learner do before accepting a result involving DAG file structure?

- A. Assume the first successful run is correct.
- B. Verify the output against the requirement and retain evidence.
- C. Remove all checks to reduce the amount of work.
- D. Add unrelated tools before understanding the concept.
